

# Callis Performer

Activate your business processes

## The scenario and the need

Documented processes are generally accepted as a necessary step to higher performance and higher maturity - and now you can do even more...

To take your process performance to the next level you need to consider how to integrate your business process descriptions and project tailorings with best practices, and projects' work products and bring all that into your existing tool suite making it all one, coherent system of processes.

Functionality that helps you get the most value out of your processes includes

- Capability to **handle multiple processes**
- A way to **integrate best practices** seamlessly
- Interfaces to your existing **artifact repositories**
- Support for **project specific tailoring**
- Help to **prepare audits and appraisals**
- **Profiling** to understand process use
- **Open your processes to your existing tools**

Often, it is beneficial to support the above functionality and doing that without starting an enormous process automation project.

In our opinion, far from all processes are suited for complete automation...

### What is Callis Performer?

*Callis Performer activates your processes by integrating work products, breaking down barriers to other tools and empowering your process users by making practical tailoring possible*

## The solution

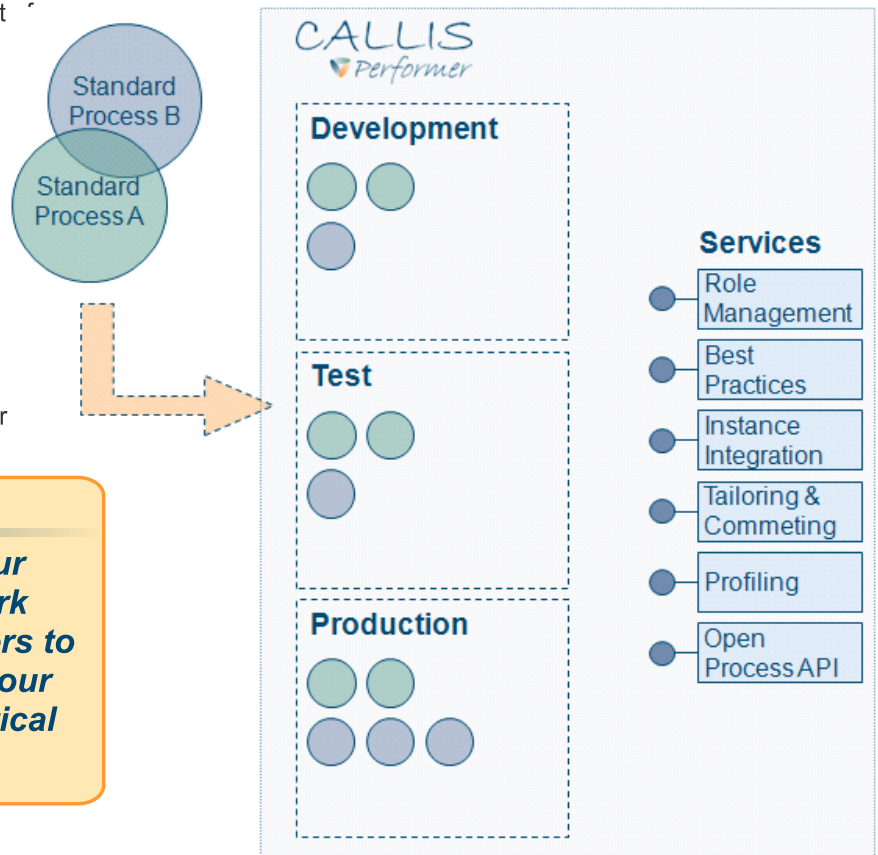

The Callis Performer process platform acts as a force multiplier and activates your processes by elegantly integrating process descriptions, tailorings, tools and work products.

Using our Open Process API and connectors it is possible to bring your process descriptions into your users' favorite tools. Imagine a setup where your process descriptions automatically and consistently are deployed and made available around your company.

Callis Performer establishes a multi-process, multi-version environment where processes can be developed and evaluated by selected process users before deploying the processes into a production environment.

Callis Performer empowers your process users by making practical tailoring lightweight and practical, without compromising your processes. Tailorings can easily be extracted and compared across projects, making it possible to build future improvements on actual tailorings.

Furthermore, best practices and instances of projects' work products can easily be integrated into your processes - making life for project practitioners easier, breaking down barriers between projects, and improving performance and efficiency in your organization. Just submit your best practices in your existing repository - and our interfaces and connectors will make it instantly available in your business process documentation and tools.

## The quick facts

MS .NET technology, MS IIS, MS SQL, single-signon, process descriptions available in XML, interface to bring process definitions to e.g. Word, Sharepoint, Eclipse, Visual Studio etc, highly scalable architecture.

Callis Performer **activates you processes** and **empower your people ...**
